SMART STORAGE SYSTEM

SMART STORAGE TANK LEVEL & USAGE PREDICTION FOR PETROCHEMICAL PLANTS

Real-Time IoT Monitoring, Predictive Analytics
& Smart Refill Decision System

Guided by: Prof. [Faculty Guide] | Dept. of Computer Engineering

TANK LEVEL MONITOR

CRITICAL ALERT

Tank 3 will be empty in 1.8 hrs

12	99.7%	±2%
Tanks Monitored	Uptime	Accuracy

Powered by

- ESP32
- ThingSpeak
- React
- Node.js
- Power BI

Problem Statement

Why traditional storage management is failing

Manual Monitoring

Staff rely on visual checks and physical gauges — unreliable, time-consuming, and prone to human error.

Overflow & Underflow

Without automated thresholds, tanks frequently overflow wasting water or run dry causing critical shortages.

No Predictive Insight

Zero capability to forecast when tanks will empty or when to schedule refills — purely reactive management.

No Anomaly Detection

Sudden leaks, sensor failures or abnormal spikes go undetected until damage is already done.

30–40% of liquid is wasted globally due to poor monitoring infrastructure — IoT-driven systems can reduce this by up to 25%

Project Objectives

What this system is designed to achieve

01

Live IoT Monitoring

Continuous real-time chemical level data via ESP32 ultrasonic sensors streamed to ThingSpeak cloud.

02

Predictive Refill System

Time-to-empty forecasting using consumption rate analysis with smart refill priority scoring.

03

Anomaly Detection

Automatic detection of sudden drops, leaks, sensor failures and abnormal consumption spikes.

04

Real-Time Web Dashboard

Operational React dashboard with live gauges, trend charts, alerts and multi-tank monitoring.

05

Power BI Analytics

Historical KPI reporting, consumption trend analysis and executive-level visual dashboards.

06

Smart Alert Engine

Critical / Warning / Normal threshold alerts with refill recommendations and anomaly cards.

Solution Overview

End-to-end smart petrochemical management ecosystem

IoT Layer

ESP32 + Sensors

Cloud Layer

ThingSpeak API

Backend Layer

Node.js Processing

Dashboard

React Web App

Analytics

Power BI Reports

Sensor Collection

Ultrasonic distance sensors + water-level probes attached to ESP32 microcontroller capture real-time petrochemical level data every 5 seconds.

Cloud Ingestion

ESP32 transmits readings to ThingSpeak IoT cloud via HTTP/MQTT. Data is timestamped and stored for historical retrieval.

Intelligent Processing

Node.js backend computes volume, fill %, consumption rate, time-to-empty predictions and anomaly scores from raw sensor data.

Visual Reporting

React dashboard provides live operational visibility. Power BI delivers historical trend analysis and executive reporting.

System Architecture

Complete data flow from physical sensors to business intelligence

PERCEPTION

Ultrasonic Sensors + Water-Level Probes

Physical sensing — distance & presence

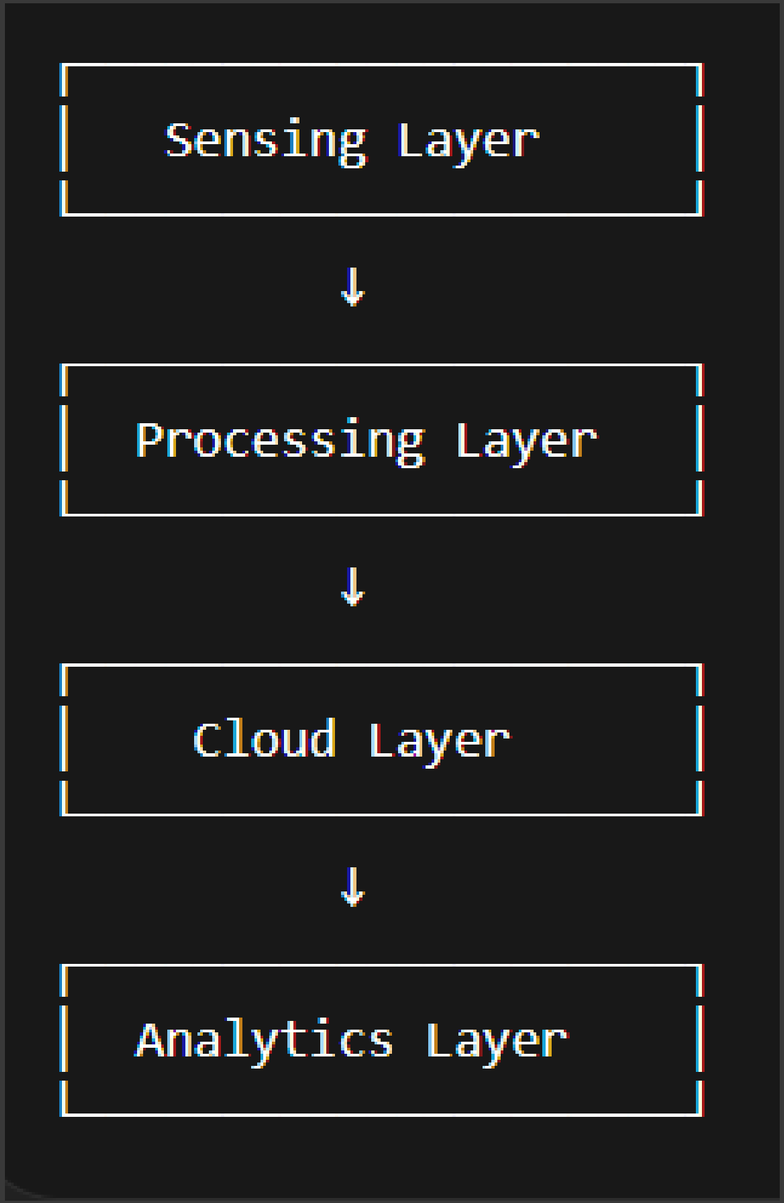
LAYERS

- IoT / Cloud
- Processing
- Output

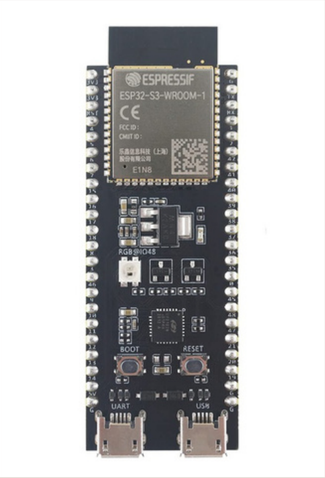
System Architecture

- Sensing Layer: Ultrasonic + Water Sensors
- Processing Layer: ESP32-S3
- Cloud Layer: ThingSpeak
- Analytics Layer: ML model



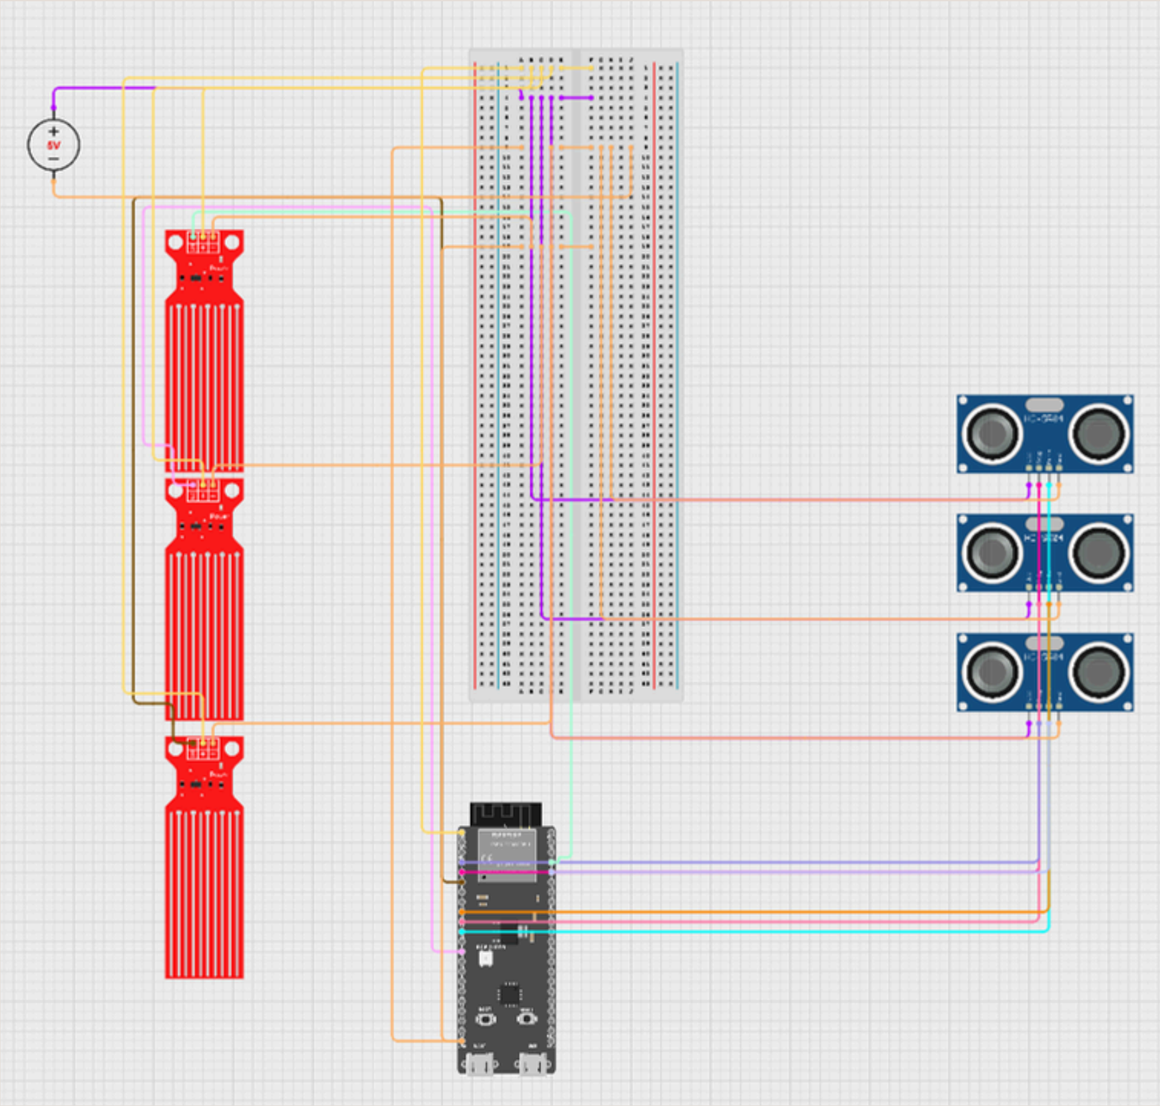
Hardware Components Used

- ESP32-S3 (beta)
- 3 HC-SR04 ultrasonic sensors
- 3 water level sensors
- Breadboard
- 5V power supply
- Jumper wires



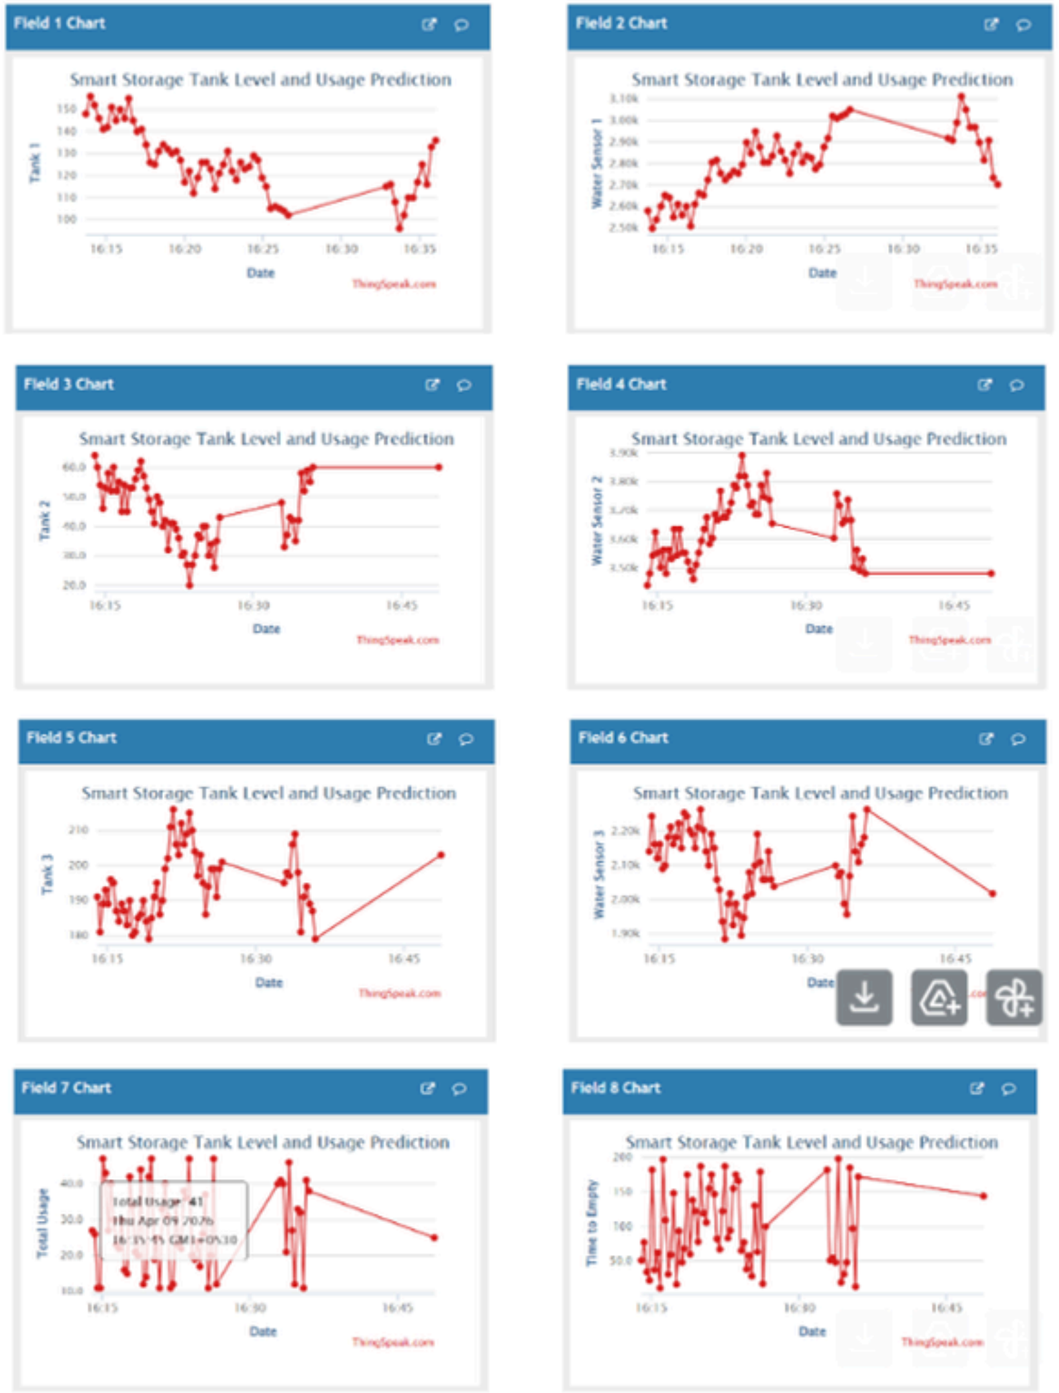
Circuit Design & Working

- 3 tanks represented in prototype.
- Each tank has:
  - 1 ultrasonic sensor
  - 1 water sensor
- ESP32 collects sensor data.
- Common power and ground setup.
- Data sent every 15 seconds.



Cloud Dashboard (ThingSpeak)

- Real-time monitoring dashboard.
- 8 graphs displayed:
  - Tank 1 level
  - Tank 2 level
  - Tank 3 level
  - Water sensor 1
  - Water sensor 2
  - Water sensor 3
  - Total usage
  - Time to empty



Technology Stack

Hardware components & software technologies powering the system

HARDWARE

ESP32 Microcontroller

Dual-core 240MHz · Wi-Fi + Bluetooth · 38 GPIO pins · Low power consumption

Ultrasonic Sensor (HC-SR04)

Range: 2–400cm · Accuracy ±3mm · 40kHz pulse · Waterproof variant

Water Level Sensor

Resistive probe · Float switch backup · IP67 rated · Analog output

SOFTWARE

ThingSpeak

IoT Cloud Platform

MQTT ingestion · REST API · Channel feeds · Real-time alerts · Visualisation

React.js

Frontend Framework

Component-based UI · Hooks · React Query · Recharts library · Responsive design

Tailwind CSS

Styling Framework

Utility-first · Dark theme · Responsive · Custom design tokens

Node.js

Backend Runtime

Express server · ThingSpeak API integration · WebSocket streams · REST endpoints

Power BI

Analytics Platform

KPI dashboards · Historical trends · Scheduled refresh · Embedded reports

Data Flow Pipeline

From raw sensor input to actionable alerts — every processing step

1 **Sensor Data Capture**

Raw distance readings every 5s

2 **Signal Filtering**

Moving average noise reduction

3 **ThingSpeak API Ingestion**

MQTT push to cloud channels

4 **Backend Processing**

Node.js data transformation

5 **Volume Calculation**

Distance → Fill % → Litres

6 **Consumption Estimation**

Rate (L/hr) per time window

7 **Time-to-Empty Prediction**

Volume ÷ Consumption Rate

8 **Alerts + Dashboard Output**

Critical / Warning / Normal

Real-Time Web Dashboard

Operational monitoring layer — built with React + Tailwind CSS + Node.js

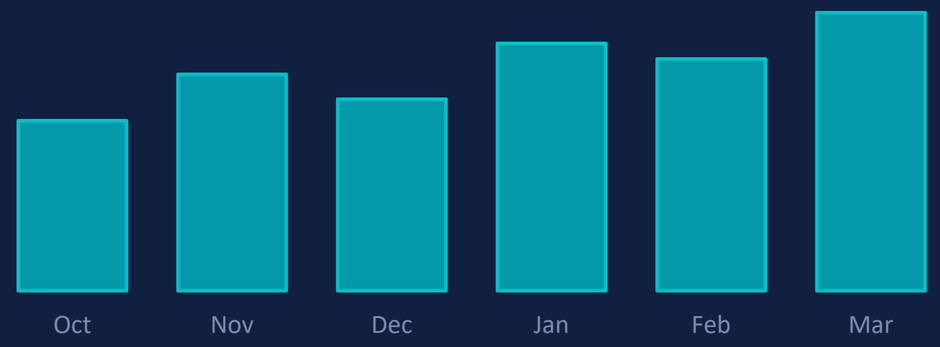
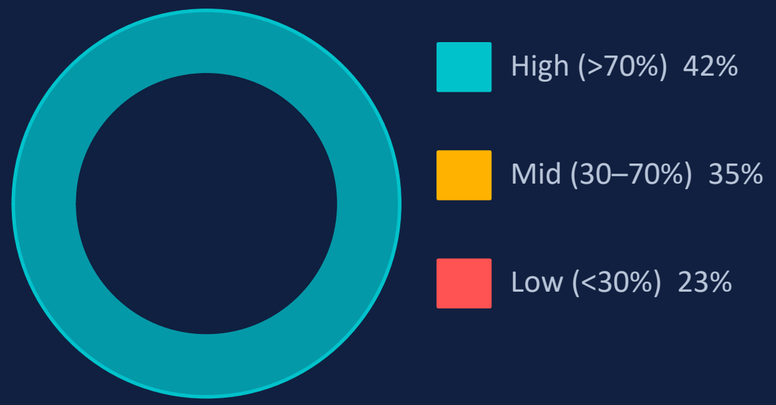
Total Water Used	Avg Fill Level	Refill Events	Anomalies Found
↑ 8.3%	↓ 4.1%	↑ 2	↓ 3

Monthly Consumption Trend (L)



Tank Fill Distribution



Core Logic & Derived Metrics

Key calculations powering intelligent decision-making

Fill Percentage

```
Fill% = ((Max Distance – Measured Distance) / Max Distance) × 100
```

Ultrasonic sensor measures air gap. Fill % derived by comparing measured distance against calibrated empty (max) distance.

Liquid Volume (Litres)

```
Volume = Fill% × Tank Capacity (L) / 100
```

Actual liquid volume calculated from fill percentage and the physical tank capacity configured during setup.

Consumption Rate

```
Rate (L/hr) = ΔVolume / Δtime
```

Time-to-Empty

```
TTE (hrs) = Current Volume / Consumption Rate
```

Refill Priority Score

```
Score = (1 – Fill%) × Urgency Weight + Consumption Factor
```

Predictive Alert System

Three-tier threshold engine with smart refill recommendations

CRITICAL

Fill < 15% | TTE < 2 hrs

- Tank 3 will be empty in 1.8 hrs
- Initiate emergency refill immediately
- Consumption rate: 8.2 L/hr (spike detected)

WARNING

Fill 15–30% | TTE 2–6 hrs

- Tank 2 at 28% — refill within 4.5 hrs
- Schedule refill before end of shift
- Monitor Tank 2 closely — trend declining

NORMAL

Fill > 30% | TTE > 6 hrs

- All systems nominal ✓
- Tank 1 at 72% — no action required
- Next scheduled review: 6 hrs

Alert Decision Logic

- If Fill% < 15% OR TTE < 2hrs → CRITICAL alert + auto-page operator
- If Fill% 15–30% OR TTE 2–6hrs → WARNING alert + schedule recommendation
- If Consumption Rate spikes >50% in 15min → Anomaly alert triggered

Anomaly Detection & Smart Decision Engine

Detecting abnormal patterns and triggering intelligent responses

Sudden Level Drop

Level drops >15% within 10 minutes indicates possible leak or pipe burst. Triggers CRITICAL alert immediately.

Sensor Failure

No data received for >30s or readings outside physical range (0–400cm). System switches to last-known state.

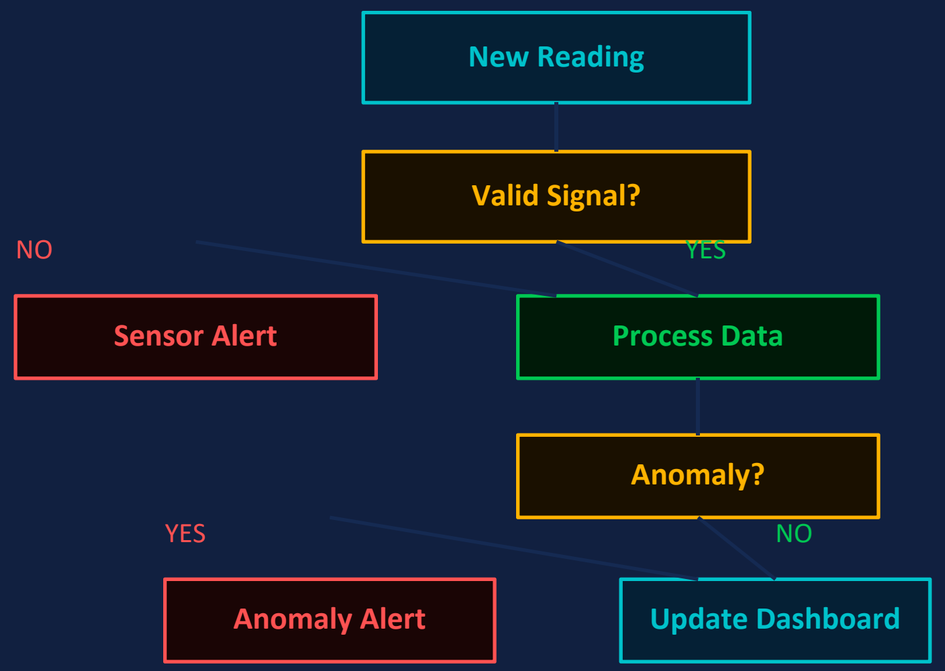
Abnormal Spike

Sudden increase in level without a scheduled refill event. May indicate sensor noise or unauthorized fill.

Consumption Pattern

Usage deviates >2σ from 7-day historical baseline. Flags potential overconsumption or system fault.

Decision Workflow



Key Challenges & Engineering Solutions

Real-world problems encountered and how we solved them

CHALLENGE		✓ SOLUTION
✗ Noisy ultrasonic sensor data with erratic readings	→	✓ Applied 5-point moving average + outlier rejection (>3σ from rolling mean)
✗ Missing data when ThingSpeak API is throttled	→	✓ Retry logic with exponential backoff + local ESP32 buffer for 60s of readings
✗ Inconsistent consumption rate due to batched usage	→	✓ Sliding 30-minute window average replaces instantaneous rate calculation
✗ Dashboard latency from polling ThingSpeak every 15s	→	✓ Node.js WebSocket layer pushes updates to clients in real-time (<500ms)

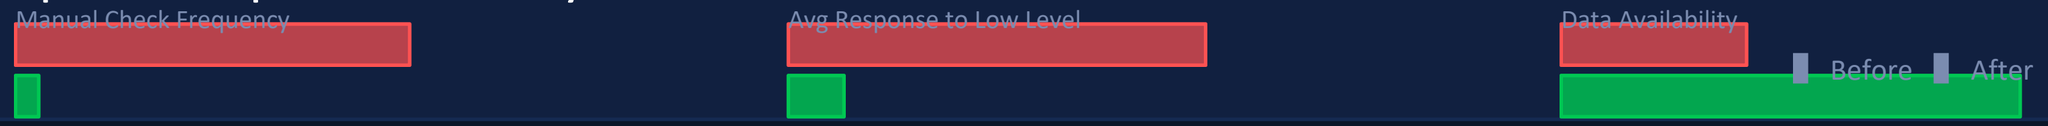
Operational Improvement Summary



Industry Applications

Scalable across verticals — from residential to smart city infrastructure

Residential Apartments

Multi-tank monitoring for large apartment complexes with per-floor usage tracking and automated refill scheduling.

Market: 15M+ units in India alone

Smart Cities

Integration with municipal IoT infrastructure. Centralized monitoring across hundreds of public tanks and reservoirs.

Use case: AMC, civic bodies

Industrial Facilities

Process water monitoring in manufacturing plants, cooling towers, and chemical processing units requiring precision tracking.

Reduces process downtime by 20%

Agriculture & Irrigation

Smart irrigation tank monitoring integrated with soil sensors and weather APIs for demand-driven water distribution.

Saves 30–40% irrigation water

Municipal Water Systems

Large-scale deployment across water distribution networks with zone-level monitoring and NRW (non-revenue water) analysis.

Critical for Jal Jeevan Mission

Future Scope & Roadmap

Planned enhancements for production deployment and scale

Phase 1 — Q3 2025

Phase 2 — Q4 2025

Phase 3 — Q1 2026

Phase 4 — Q2 2026

ML-Based Forecasting

Phase 1

Replace rule-based predictions with LSTM neural network trained on 90-day consumption patterns. Enable seasonal demand forecasting with 95%+ accuracy.

SMS / Email Alert Integration

Phase 1

Push notifications via Twilio SMS and SendGrid email. Configurable escalation chains — Operator → Supervisor → Manager based on alert duration.

Cross-Platform Mobile App

Phase 2

React Native app for Android & iOS. Offline-capable with local SQLite cache. Biometric login, push alerts and tank management on-the-go.

Digital Twin Simulation

Phase 3

3D virtual tank models synced with live data. Simulate fill/drain scenarios, test alert thresholds, and train staff on procedures without physical risk.

Multi-Site Cloud Deployment

Phase 3

Kubernetes microservices deployment on AWS/Azure. Multi-tenant architecture supporting 1000+ tanks across geographically distributed client sites.

AI-Powered Analytics Dashboard

Phase 4

Embedded AI assistant for natural language queries on Power BI. Ask 'Which tank had the highest consumption last week?' and get instant visual answers.
